

Hard Cider

Beer Man's Hard Cider Recipe.

Ingredients:

- * 5 gallons apple juice **without** preservatives such as **potassium sorbate**. Use juice that has been pasteurized. Fresh squeezed apple juice. (no preservatives or pasteurization) will also work, just use it quickly so the wild yeast from the apple skins will not take over.
- * 2 pounds sugar (try different types, brown sugar, honey, raw sugar and even white sugar)
- * Beer yeast or wine yeast or cider yeast (never use bread yeast. Bread yeast makes poor tasting cider)
- * Carbonation drops

Procedure:

- 1) Sanitize your fermenter, fermenter lid, spigot, brewing paddle and airlock the same way you would if making beer in your Beer Man Microbrewery
- 2) Add sugar to fermenter
- 3) Pour 1 or 2 gallons of apple juice on to sugar
- 4) Stir with your sanitized brewing paddle to dissolve sugar
- 5) Top up with remaining apple juice to five or six gallon splashing the cider as you pour it into the fermenter.
- 6) Sprinkle yeast on to the foam/cider and seal the lid on fermenter. Place airlock half full with water in the lid.
- 7) Allow to ferment for 1 to 2 weeks (until no CO2 escapes from your airlock for 4 days)
- 8) Bottle using carbonation tabs (See Beer Man Microbrewery directions for bottling procedure)
- 9) Age for 1 month or longer in the bottle.

Variances to recipe.

- 1) Use one gallon (or more) of a different juice such as peach or apricot.
- 2) For more apple flavor add 1 can of frozen apple juice concentrate to the juice (don't add the water in the directions on the can. Remember NO potassium sorbate!)
- 3) Add more sugar for more alcohol. Be careful. The more alcohol the cider has the longer you will need to age the hard cider to smooth it out
